

# Package ‘geohabnet’

December 22, 2023

**Title** Analysis of Cropland Connectivity

**Version** 1.0.1

**Date** 2023-10-29

**Description** Geographical spatial analysis of cropland connectivity.

Allows users to visualize risk index plots for a given set of crops.

The functions are developed as an extension to analysis from Xing et al (2021) <[doi:10.1093/biosci/biaa067](https://doi.org/10.1093/biosci/biaa067)>.

The primary function is sean() and is indicative of how sensitive the risk analysis is to parameters using kernel models.

The Package currently supports crops sourced from Monfreda, C., N. Ramankutty, and J. A. Foley (2008) <[doi:10.1029/2007gb002947](https://doi.org/10.1029/2007gb002947)> ``Farming the planet: 2. Geographic distribution of crop areas, yields, physiological types, and net primary production in the year 2000, Global Biogeochem. Cycles, 22, GB1022" and International Food Policy Research Institute (2019) <[doi:10.7910/DVN/PRFF8V](https://doi.org/10.7910/DVN/PRFF8V)> ``Global Spatially-Disaggregated Crop Production Statistics Data for 2010 Version 2.0, Harvard Dataverse, V4".

This analysis produces 3 maps - mean, variance, and difference for the crop risk index. It applies distance functions and graph operations on a network to calculate risk index.

There are multiple ways in which functions can be used - generate final outcome and then the intermediate outcomes for more sophisticated use cases. Refer to vignettes.

sean() will set some global variables which can be accessed using \$ prefix. These values are propagated to other functions for performing operations such as distance matrix calculation.

parameters.yaml stores the parameters and values and can be accessed using get\_parameters(). Refer it's usage.

The objective of this package is to support risk analysis using cropland connectivity on 10 parameters -

host crops, density threshold, aggregation and distance method, resolution, geographic extent, link threshold, kernel models, network metrics and maps.

These parameters serves as an input and are used different phases of analysis workflow.

ccri\_diff

*Calculate difference map*

## Description

This function produces a map of difference b/w mean and sum indexes in rank of cropland harvested area fraction.

## Usage

```
ccri_diff(x, y, global, geoscale, res = reso(), outdir = tempdir())
```

## Arguments

|          |   |
|----------|---|
| x        | SpatRaster.   |
| y        | SpatRaster.   |
| global   | Logical. TRUE if global analysis is required, FALSE otherwise. east and west are required when TRUE.                          |
| geoscale | Numeric vector. x will be cropped to this extent.   |
| res      | Numeric. Map resolution. This value is used in aggregation and dis-aggregation operation. Default is <a href="#">reso()</a> . |
| outdir   | Character. Output directory for saving raster in TIFF format. Default is <a href="#">tempdir()</a> .                          |
| rast     | SpatRaster. A template raster to hold the cell-wise difference  |

## Details

Ideally, the function is tested to yield desired results when `length(which(y[] > 0)) > length(which(x[] > 0))`.

## Value

RiskMap. Contains result in the form of SpatRaster objects and file path of the saved maps.

---

|           |   |
|-----------|---|
| ccri_mean | <i>Calculate mean of raster objects</i> |
|-----------|---|

---

### Description

Wrapper for `terra::mean()`. Calculates mean of list of rasters.

### Usage

```
ccri_mean(
  indices,
  global = FALSE,
  east = NULL,
  west = NULL,
  geoscale = NULL,
  plt = TRUE,
  outdir = tempdir()
)
```

### Arguments

|          |  |
|----------|--|
| indices  | List of SpatRasters. This input represents the spatial raster collection for which mean is to be calculated. |
| global   | Logical. TRUE if global analysis is required, FALSE otherwise. east and west are required when TRUE.         |
| east     | SpatRaster. Collection of risk indices on eastern extent.  |
| west     | SpatRaster. Collection of risk indices on western extent. When TRUE, geoscale is ignored. Default is TRUE.   |
| geoscale | Vector. geographical scale. Default is NULL.   |
| plt      | TRUE if need to plot mean map, FALSE otherwise.  |
| outdir   | Character. Output directory for saving raster in TIFF format. Default is <code>tempdir()</code> .            |

### Value

RiskMap. Contains result in the form of SpatRaster objects and file path of the saved maps.

---

|               |                                   |
|---------------|-----------------------------------|
| ccri_variance | <i>Calculate variance of CCRI</i> |
|---------------|-----------------------------------|

---

### Description

This function produces a map of variance of CCRI based on input parameters

**Usage**

```
ccri_variance(
  indices,
  rast,
  global,
  east = NULL,
  west = NULL,
  geoscale,
  res = reso(),
  outdir = tempdir()
)
```

**Arguments**

|                       |   |
|-----------------------|---|
| <code>indices</code>  | SpatRaster. Collection of risk indices.   |
| <code>rast</code>     | SpatRaster. Template for variance output  |
| <code>global</code>   | Logical. TRUE if global analysis is required, FALSE otherwise. east and west are required when TRUE.                          |
| <code>east</code>     | SpatRaster. Collection of risk indices on eastern extent.   |
| <code>west</code>     | SpatRaster. Collection of risk indices on western extent. When TRUE, geoscale is ignored. Default is TRUE.                    |
| <code>geoscale</code> | Vector. geographical scale. Default is NULL.  |
| <code>res</code>      | Numeric. Map resolution. This value is used in aggregation and dis-aggregation operation. Default is <a href="#">reso()</a> . |
| <code>outdir</code>   | Character. Output directory for saving raster in TIFF format. Default is <a href="#">tempdir()</a> .                          |

**Value**

RiskMap. Contains result in the form of SpatRaster objects and file path of the saved maps.

---

|              |                                |
|--------------|--------------------------------|
| connectivity | <i>Calculate and plot maps</i> |
|--------------|--------------------------------|

---

**Description**

Calculate mean, variance and difference. The result is produced in form of maps plotted with predefined settings. Currently, the settings for plot cannot be customized. Default value is TRUE for all logical arguments

**Usage**

```
connectivity(
  host,
  indices,
  global = FALSE,
  east = NULL,
  west = NULL,
  geoscale = NULL,
  res = reso(),
)
```

```

pmean = TRUE,
pvar = TRUE,
pdiff = TRUE,
outdir = tempdir()
)

```

### Arguments

|          |  |
|----------|--|
| host     | SpatRaster. Host density map or raster.  |
| indices  | SpatRaster. Collection of risk indices.  |
| global   | Logical. TRUE if global analysis is required, FALSE otherwise. east and west are required when TRUE.                       |
| east     | SpatRaster. Collection of risk indices on eastern extent.  |
| west     | SpatRaster. Collection of risk indices on western extent. When TRUE, geoscale is ignored. Default is TRUE.                 |
| geoscale | Vector. geographical scale. Default is NULL.   |
| res      | Numeric. Map resolution. This value is used in aggregation and dis-aggregation operation. Default is <code>reso()</code> . |
| pmean    | Logical. TRUE if map of mean should be plotted, FALSE otherwise.   |
| pvar     | Logical. TRUE if variance map should be plotted, FALSE otherwise.  |
| pdiff    | Logical. TRUE if difference map should be plotted, FALSE otherwise.  |
| outdir   | Character. Output directory for saving raster in TIFF format. Default is <code>tempdir()</code> .                          |

### Details

indexes are actually risk indices representing in the form of spatRaster resulting from operations on crop's raster and parameters provided in either `parameters.yaml` or `sean()`.

It will save all the opted plots using - pmean, pvar and pdiff. File will be saved in provided value of outdir or `tempdir()`. If `interactive()` is TRUE, then plots can be seen in active plot window. E.g. Rstudio. The maps are plotted using SpatRaster object. These objects are available as a return value of this function.

### Value

Gmap. See details.

|------------------|-----------------------------------|
| cropharvest_rast | <i>Get raster object for crop</i> |
|------------------|-----------------------------------|

---

**Description**

Get cropland information in a form of raster object from data source for crop

**Usage**

```
cropharvest_rast(crop_name, data_source)
```

**Arguments**

|             |                                      |
|-------------|--------------------------------------|
| crop_name   | Name of the crop                     |
| data_source | Data source for cropland information |

**Value**

Raster.

**Examples**

```
cropharvest_rast("avocado", "monfreda")
```

---

|            |  |
|------------|--|
| crops_rast | <i>Get sum of rasters for individual crops</i> |
|------------|--|

---

**Description**

Takes crop names and returns raster object which is sum of raster of individual crops. Currently, only supports crops listed in [geodata::monfredaCrops\(\)](#), [geodata::spamCrops\(\)](#) If crop is present in multiple sources, then their mean is calculated.

**Usage**

```
crops_rast(crop_names)
```

**Arguments**

|            |  |
|------------|--|
| crop_names | A named list of source along with crop names |
|------------|--|

**Value**

SpatRaster. Raster object which is sum of all the individual crop raster

**Examples**

```
crops_rast(list(monfreda = c("wheat", "barley"), mapspam = c("wheat", "potato")))
```

---

|              |                                   |
|--------------|-----------------------------------|
| dist_methods | <i>Distance methods supported</i> |
|--------------|-----------------------------------|

---

**Description**

Contains supported strategies to calculate distance between two points. Use of one the methods in [sean\(\)](#) or [sensitivity\\_analysis\(\)](#).

**Usage**

dist\_methods()

**Value**

vector

**Examples**

dist\_methods()

---

|                |                       |
|----------------|-----------------------|
| GeoModel-class | <i>GeoModel class</i> |
|----------------|-----------------------|

---

**Description**

A ref class to represent results of dispersal models.

**Fields**

matrix An adjacency matrix to represent network.

---

|                  |                   |
|------------------|-------------------|
| GeoNetwork-class | <i>GeoNetwork</i> |
|------------------|-------------------|

---

**Description**

An S4 class representing a network of geographical data. This will wrap all the results from the risk analysis using [sean\(\)](#) or [sensitivity\\_analysis\(\)](#). This class contains the field from Gmap class which has results in the form of SpatRaster and TIFF file.

**Slots**

rasters A list of GeoRasters objects.

---

|                  |                        |
|------------------|------------------------|
| GeoRasters-class | <i>GeoRaster class</i> |
|------------------|------------------------|

---

**Description**

A class to represent raster vis-a-vis risk indices. This class encapsulates the results of apply dispersal models and metrics.

**Fields**

`rasters` List. List of raster representing risk indices. These are of type `GeoModels`.  
`global` Boolean. True if contains `GlobalRast` object, False otherwise.

---

|                             |  |
|-----------------------------|--|
| <code>geoscale_param</code> | <i>Get geographical scales from the parameters</i> |
|-----------------------------|--|

---

**Description**

This function returns a list of geographical scales set in global and custom extent in `parameters.yaml`. If `global` is TRUE, the `CustomExt` is ignored.

**Usage**

```
geoscale_param()
```

**Value**

Vector. A set of geographical scales

---

|                             |                       |
|-----------------------------|-----------------------|
| <code>get_parameters</code> | <i>Get Parameters</i> |
|-----------------------------|-----------------------|

---

**Description**

Retrieves the parameters and copies the parameter file to the specified output path.

**Usage**

```
get_parameters(out_path = tempdir(), iwindow = FALSE)
```

**Arguments**

`out_path` character. The output path where the parameter file will be copied. Default is temporary directory `tempdir()`  
`iwindow` logical. If TRUE, prompts the user to select the output directory using a file chooser window. Default is FALSE

## Details

Using configuration file is an alternative to [sean\(\)](#)

## Value

character. The path to the copied parameter file.

## See Also

[set\\_parameters\(\)](#)

## Examples

```
get_parameters()
get_parameters(out = tempdir())
```

---

|                   |                                    |
|-------------------|------------------------------------|
| get_param_metrics | <i>Get metrics from parameters</i> |
|-------------------|------------------------------------|

---

## Description

Get metrics and parameters stored in `parameters.yaml`.

## Usage

```
get_param_metrics(params = load_parameters())
```

## Arguments

`params` R object of [load\\_parameters\(\)](#). Default is `load_parameters()`.

## Value

List. List of metrics - parameters and values. See usage.

## Examples

```
# Get metrics from parameters
get_param_metrics()
get_param_metrics(load_parameters())
```

---

|             |   |
|-------------|---|
| get_rasters | <i>Get rasters object from parameters</i> |
|-------------|---|

---

**Description**

Takes named list of hosts as an input. See host object in [get\\_parameters\(\)](#) or [load\\_parameters\(\)](#). This is also a wrapper of [crops\\_rast\(\)](#). Function creates 2 raster object - one is a sum of all the crops specified under sources and other using the provided raster file. See [tiff\\_torast\(\)](#)

**Usage**

```
get_rasters(hosts)
```

**Arguments**

hosts                      List of hosts and values. It is synonym to Hosts object in parameters

**Value**

List of SpatRaster.

**See Also**

[load\\_parameters\(\)](#), [get\\_parameters\(\)](#), [tiff\\_torast\(\)](#), [cropharvest\\_rast\(\)](#)

**Examples**

```
# Get default rasters
## Not run:
get_rasters(list(mapspam = c("wheat"), monfreda = c("avocado"), file = "some_raster.tif"))

## End(Not run)
```

---

|                       |                                       |
|-----------------------|---------------------------------------|
| get_supported_sources | <i>Get supported sources of crops</i> |
|-----------------------|---------------------------------------|

---

**Description**

When provided, [cropharvest\\_rast\(\)](#) will look for cropland data in this specific source.

**Usage**

```
get_supported_sources()
```

**Value**

Vector of supported sources. Also used as a lookup to find get raster object.

**Examples**

```
# Get currently supported sources
get_supported_sources()
```

---

GlobalRast-class

*GlobalRast class*

---

### Description

A class to represent raster for global scales. Global scales are accessible using `global_scales()`. However, this class encapsulates the results of apply dispersal models and metrics.

### Fields

east A list of raster for eastern hemisphere.  
west A list of raster for western hemisphere.

---

global\_scales

*Global geographical extent*

---

### Description

See geographical extents used in global analysis. Returns eastern and western hemisphere extents. Each extent is in the form of c(Xmin, Xmax, Ymin, Ymax).

### Usage

```
global_scales()
```

### Details

Seperate analysis on geographical scales of eastern and western hemisphere are combined to run global analysis.

### Value

List. Named list with scales for eastern and western hemisphere

### See Also

`set_global_scales()`

Gmap-class

*Gmap class***Description**

An S4 class to represent various maps.

Set the slots in the Gmap object.

**Usage**

```
setmaps(x, me, vari, dif)
```

```
## S4 method for signature 'Gmap'
setmaps(x, me, vari, dif)
```

**Arguments**

|      |  |
|------|--|
| x    | A Gmap object.                                   |
| me   | A GeoRaster object representing mean risk index. |
| vari | A GeoRaster object representing variance.        |
| dif  | A GeoRaster object representing difference.      |

**Value**

A Gmap object.

**Slots**

me\_rast SpatRaster A raster representing mean risk index.  
 me\_out Character. A file path to the mean risk index raster.  
 diff\_rast SpatRaster A raster representing difference.  
 diff\_out Character. A file path to the difference raster.  
 var\_rast Numeric. A raster representing variance.  
 var\_out SpatRaster A file path to the variance raster.

gplot

*Plot a Raster\* object***Description**

This is a wrapper for [terra::plot\(\)](#)

**Usage**

```
gplot(x, ...)
```

**Arguments**

|     |   |
|-----|---|
| x   | a Raster* object  |
| ... | additional arguments passed to <code>terra::plot()</code> |

**Value**

a plot

**Examples**

```
r <- terra::rast(nrows=108, ncols=21, xmin=0, xmax=10)
gplot(r)
gplot(r, col = "red")
gplot(r, col = "red", breaks = 10)
```

---

load\_parameters

*Load Parameters from YAML File*

---

**Description**

This function loads parameters from a YAML file and stores them in an object.

**Usage**

```
load_parameters(filepath = .param_fp())
```

**Arguments**

|          |  |
|----------|--|
| filepath | Path to the YAML file containing the parameters. By default, it takes the value of <code>parameters.yaml</code> in R user's directory. |
|----------|--|

**Value**

object with parameters and values

**Examples**

```
# Load parameters from default file
load_parameters()
```

---

|                |   |
|----------------|---|
| model_powerlaw | <i>Calculate risk index using inbuilt models.</i> |
|----------------|---|

---

## Description

- `model_powerlaw()`: calculates risk index using power law.
- `model_neg_exp()`: calculates risk index using negative exponential.

## Usage

```
model_powerlaw(
  beta,
  link_threshold,
  distance_matrix = the$distance_matrix,
  thresholded_crop_values,
  adj_mat = NULL,
  crop_raster,
  crop_cells_above_threshold,
  metrics = the$parameters_config$`CCRI parameters`$NetworkMetrics$InversePowerLaw
)
```

```
model_neg_exp(
  gamma_val,
  link_threshold,
  distance_matrix = the$distance_matrix,
  thresholded_crop_values,
  adj_mat = NULL,
  crop_raster,
  crop_cells_above_threshold,
  metrics = the$parameters_config$`CCRI parameters`$NetworkMetrics$InversePowerLaw
)
```

## Arguments

|                            |  |
|----------------------------|--|
| beta                       | A list of beta values. DispersalParameterBeta in parameters.yaml.  |
| link_threshold             | A threshold value for link.  |
| distance_matrix            | distance matrix, generated during <code>sean()</code> .  |
| thresholded_crop_values    | crop values above threshold.   |
| adj_mat                    | Adjacency matrix(optional) representing un-directed graph network. If this is provided, then gamma_val, distance_matrix, link_threshold and thresholded_crop_values are ignored. These ignored parameters are used to generate adjacency matrix internally. This is the only way to use custom adjacency matrix. |
| crop_raster                | A raster object for cropland harvest.  |
| crop_cells_above_threshold | crop cells above threshold. Only contains cells and not the the values.  |
| metrics                    | A list 2 vectors - metrics and weights.  |
| gamma_val                  | A list of beta values. DispersalParameterGamma in parameters.yaml.   |

## Details

Network metrics should be passed as a list of vectors e.g. `list(metrics = c("betweenness"), weights = c(100))`. Default values are fetched from `parameters.yaml` and arguments uses the same structure.

## Value

risk index

---

|        |                                       |
|--------|---------------------------------------|
| nn_sum | <i>Calculation on network matrix.</i> |
|--------|---------------------------------------|

---

## Description

These are basically an abstraction of functions under the [igraph](#) package. The functions included in this abstraction are:

- `[nn_sum()]`: Calculates the sum of nearest neighbors [igraph::graph.knn\(\)](#).
- `[node_strength()]`: Calculates the sum of edge weights of adjacent nodes [igraph::graph.strength\(\)](#).
- `[betweenness()]`: Calculates the vertex and edge betweenness based on the number of geodesics [igraph::betweenness\(\)](#).
- `[ev()]`: Calculates the eigenvector centrality of positions within the network [igraph::evcent\(\)](#).
- `[closeness()]`: measures how many steps is required to access every other vertex from a given vertex [igraph::closeness\(\)](#).
- `[degree()]`: number of adjacent edges [igraph::degree\(\)](#).
- `[pagerank()]`: page rank score for vertices [igraph::page\\_rank\(\)](#).

## Usage

```
nn_sum(crop_dm, we)
```

```
node_strength(crop_dm, we)
```

```
betweenness(crop_dm, we)
```

```
ev(crop_dm, we)
```

```
degree(crop_dm, we)
```

```
closeness(crop_dm, we)
```

```
pagerank(crop_dm, we)
```

## Arguments

`crop_dm` Distance matrix. In the internal workflow, the distance matrix comes is a result of operations within [sean\(\)](#) and risk functions.

`we` Weight in percentage.

**Value**

Matrix with the mean value based on the assigned weight.

**See Also**

Other metrics: [supported\\_metrics\(\)](#)

|--------------|------------------------------|
| reset_params | <i>Reset parameters.yaml</i> |
|--------------|------------------------------|

---

**Description**

Resets the values in the parameters.yaml file to the default initial values.

**Usage**

```
reset_params()
```

**Value**

Logical. TRUE if function was successfully executed

**Examples**

```
reset_params()
```

---

|      |                             |
|------|-----------------------------|
| reso | <i>Get resolution value</i> |
|------|-----------------------------|

---

**Description**

Resolution stored in parameter.yaml. If not present it will result default value.

**Usage**

```
reso()
```

**Value**

Numeric. Resolution from parameters.yaml. Default is 24.

**See Also**

|               |                      |
|---------------|----------------------|
| RiskMap-class | <i>RiskMap class</i> |
|---------------|----------------------|

---

### Description

An S4 class representing resulting maps from the specific operation type.

### Fields

map Character. A file path to the map.  
 riid SpatRaster. This is one of the risk maps.  
 spr SpatRaster. A spatial raster representing the risk index.  
 fp Character. A file path to the risk index raster.

---

|              |                         |
|--------------|-------------------------|
| risk_indices | <i>Get risk indices</i> |
|--------------|-------------------------|

---

### Description

Get risk indices from GeoRasters object.

### Usage

```
risk_indices(ri)
```

### Arguments

ri                      GeoRasters object

### Value

List of risk indices. If the ri is global, the list will contain two elements, one for each hemisphere.

---

|              |                                 |
|--------------|---------------------------------|
| sa_onrasters | <i>Run sensitivity analysis</i> |
|--------------|---------------------------------|

---

### Description

Same as [sensitivity\\_analysis\(\)](#) but it takes raster object and other parameters as an input.

- sa\_onrasters() is a wrapper around [sean\(\)](#) function. Takes raster object and other parameters as an input.
- msean\_onrast() same as [sa\\_onrasters\(\)](#). Use this for side effects + results. Produces and plots the maps for the outcomes and results are returned as an object. It produces and plots the maps for the outcomes and results are returned as an object.

**Usage**

```
sa_onrasters(
  rast,
  global = TRUE,
  geoscale,
  link_thresholds,
  host_density_thresholds,
  agg_methods = c("sum", "mean"),
  dist_method = "geodesic",
  res = reso()
)

msean_onrast(
  global = TRUE,
  geoscale = NULL,
  res = reso(),
  outdir = tempdir(),
  ...
)
```

**Arguments**

|                                      |   |
|--------------------------------------|---|
| <code>rast</code>                    | Raster object which will be used in analysis.   |
| <code>global</code>                  | Logical. TRUE if global analysis, FALSE otherwise. Default is TRUE                                |
| <code>geoscale</code>                | Numeric vector. Geographical coordinates in the form of <code>c(Xmin, Xmax, Ymin, Ymax)</code>    |
| <code>link_thresholds</code>         | Numeric vector. link threshold values   |
| <code>host_density_thresholds</code> | Numeric vector. host density threshold values   |
| <code>agg_methods</code>             | vector. Aggregation methods   |
| <code>dist_method</code>             | Character. One of the values from <code>dist_methods()</code>                                     |
| <code>res</code>                     | Numeric. resolution at which operations will run. Default is <code>reso()</code>                  |
| <code>outdir</code>                  | Character. Output directory for saving raster in TIFF format. Default is <code>tempdir()</code> . |
| <code>...</code>                     | arguments passed to <code>sa_onrasters()</code>   |

**Details**

When `global = TRUE`, `geo_scale` is ignored. Instead uses scales from `global_scales()`.

**Value**

A list of calculated CCRI indices after operations. An index is generated for each combination of paramters. One combination is equivalent to `sean()` function.

`msean_onrast()`

## Examples

```
rr <- get_rasters(list(monfreda = c("avocado")))
res1 <- sa_onrasters(rr[[1]],
  global = FALSE,
  geoscale = c(-115, -75, 5, 32),
  c(0.0001, 0.00004),
  c(0.0001, 0.00005),
  c("sum", "mean"),
  res = 24)
res2 <- sa_onrasters(rr[[1]],
  global = TRUE,
  link_thresholds = c(0.000001),
  host_density_thresholds = c(0.00015),
  agg_methods = c("sum"),
  res = 24)
res3 <- msean_onrast(rast = rr[[1]],
  link_thresholds = c(0.000001),
  host_density_thresholds = c(0.00015))
```

---

sean

*Calculate sensitivity analysis on cropland harvested area fraction*

---

## Description

This function calculates sensitivity analysis on cropland harvested area fraction based on provided parameters. Some parameters are only accessible from `parameters.yaml` and uses value from here. `sensitivity_analysis()` is a wrapper around `sean()` function.

- `msean()` is a wrapper around `sean()` function. It has additional argument to specify maps which are calculated using `connectivity()` function. The maps are essentially the risk network.

## Usage

```
sean(
  rast,
  global = TRUE,
  geoscale = NULL,
  agg_methods = c("sum", "mean"),
  dist_method = "geodesic",
  link_threshold = 0,
```

```

    host_density_threshold = 0,
    res = reso()
  )

msean(..., global = TRUE, geoscale = NULL, res = reso(), outdir = tempdir())

```

### Arguments

|                                     |   |
|-------------------------------------|---|
| <code>rast</code>                   | Raster object which will be used in analysis.   |
| <code>global</code>                 | Logical. TRUE if global analysis, FALSE otherwise. Default is TRUE                                |
| <code>geoscale</code>               | Numeric vector. Geographical coordinates in the form of <code>c(Xmin, Xmax, Ymin, Ymax)</code>    |
| <code>agg_methods</code>            | vector. Aggregation methods   |
| <code>dist_method</code>            | Character. One of the values from <code>dist_methods()</code>                                     |
| <code>link_threshold</code>         | Numeric. A threshold value for link   |
| <code>host_density_threshold</code> | Numeric. A host density threshold value   |
| <code>res</code>                    | Numeric. resolution at which operations will run. Default is <code>reso()</code>                  |
| <code>...</code>                    | arguments passed to <code>sean()</code>   |
| <code>outdir</code>                 | Character. Output directory for saving raster in TIFF format. Default is <code>tempdir()</code> . |

### Details

When `global = TRUE`, `geoscale` is ignored and `global_scales()` is used. What makes `sean()` different from `msean()` is thier return value. The return value of `msean()` is GeoNetwork contains the result from applying `connectivity()` function on the risk indexes. Essentially, the risk maps.

### Value

GeoRasters.  
GeoNetwork.

```
avocado <- cropharvest_rast("avocado", "monfreda")

# global
ri <- sean(avocado) # returns a list of GeoRasters
mri <- msean(rast = avocado) # returns GeoNetwork object

# non-global
# geoscale is a vector of xmin, xmax, ymin, ymax

# returns GeoRasters object
ri <- sean(avocado, global = FALSE, geoscale = c(-115, -75, 5, 32))
ri

# returns GeoNetwork object
mri <- msean(rast = avocado, global = FALSE, geoscale = c(-115, -75, 5, 32))
mri
```

search\_crop

*Search for crop***Description**

It returns the dataset sources in which crop data is available. It's a wrapper around `geodata::spamCrops()` and `geodata::monfredaCrops()`

**Usage**

```
search_crop(name)
```

**Arguments**

|      |              |
|------|--------------|
| name | name of crop |
|------|--------------|

**Value**

Logical. Sources in which crop data is available.

**See Also**

`get_supported_sources()`

**Examples**

```
search_crop("coffee")
search_crop("wheat")

search_crop("jackfruit")
```

---

sensitivity\_analysis    *Calculate sensitivity analysis on parameters*

---

## Description

This function runs sensitivity analysis on parameters based on parameters provided through `set_parameters()`. If no parameters are provided, then it will run analysis on default parameters which is accessible through `get_parameters()`. It can be used as an entry point for Cropland .connectivity risk index vis-a-vis CCRI. By default, it runs analysis on global scales `global_scales()`. After analysis is complete, it will suppress maps for outcomes if `maps = FALSE` or `interactive()` is `FALSE`. There are 2 results. The side effects are the plotted maps. The returned object is of class `GeoNetwork`. It contains risk indices with corresponding adjacency matrices along with final maps from the outcome.

## Usage

```
sensitivity_analysis(maps = TRUE, alert = TRUE)
```

## Arguments

|                    |  |
|--------------------|--|
| <code>maps</code>  | logical. TRUE if maps are to be plotted, FALSE otherwise     |
| <code>alert</code> | logical. TRUE if beep sound is to be played, FALSE otherwise |

## Value

`GeoNetwork`. Errors are not handled.

ss3 <- sensitivity_analysis(TRUE, FALSE)
```

---

|                   |                                       |
|-------------------|---------------------------------------|
| set_global_scales | <i>Set global geographical extent</i> |
|-------------------|---------------------------------------|

---

**Description**

Set the geographical extents used in global analysis. Each extent should be in the form of c(Xmin, Xmax, Ymin, Ymax)

**Usage**

```
set_global_scales(value)
```

**Arguments**

|       |  |
|-------|--|
| value | list. Named list of eastern and western hemisphere extents. See usage. |
|-------|--|

**Value**

List. Named list with scales for eastern and western hemisphere

**See Also**

[global\\_scales\(\)](#) [terra::ext\(\)](#)

**Examples**

```
set_global_scales(list(east = c(-24, 180, -58, 60), west = c(-140, -34, -58, 60)))

|-------------|--|
| tiff_torast | <i>Get raster object from tif file</i> |
|-------------|--|

---

**Description**

This is a wrapper of `terra::rast()` and generates a raster object if provided with a TIF file.

**Usage**

```
tiff_torast(path_to_tif)
```

**Arguments**

`path_to_tif`      TIFF file. This is an encoding of map in raster format.

**Value**

SpatRaster.

**Examples**

```
# Generate raster for usage
fp <- paste(tempfile(), ".tif", sep = "")
ret <- utils::download.file(
  "https://geohabnet.s3.us-east-2.amazonaws.com/util-rasters/avocado_HarvestedAreaFraction.tif",
  destfile = fp, method = "auto", mode = "wb")
tiff_torast(fp)
```
